

Local stricter selection: no corrected evidence of reduced linkage

Left of zero would mean less native linkage. Bars: identity-bootstrap 95% intervals, conditional on three key seeds.

20 candidates; 200 development pairs; score band $[-0.5, 0.5]$. Paired Holm family 2; neither comparison passes 0.05.

Local operationalization, not source-exact replication or a refutation of all stricter PolyProtect parameter policies.
