

What the proposed algorithm does

BIOMETRIC KEY-PROVENANCE ANALYSIS | 25 SEPTEMBER 2026

Question: can source analysis find recurring biometric transforms, explain the path, and trigger a testable remediation?

Claim boundary

The analyzer classifies key scope under explicit contracts. It does not certify secrecy, unlinkability, deployment security, or utility.

Analyzer evidence improved from v1 to v3

BIOMETRIC KEY-PROVENANCE ANALYSIS | 25 SEPTEMBER 2026

Frozen confirmation

19 / 19 decisions correct
1 conservative abstention
0 false-fresh

Combined v3 study

25 / 25 decisions correct
96.15% coverage
All fixed gates pass

Executable scheme integration and baseline

BIOMETRIC KEY-PROVENANCE ANALYSIS | 25 SEPTEMBER 2026

Executable recipe	Recurring pool	Record-specific
BioHash	Reuse	Fresh
IoM-GRP	Reuse	Fresh
PolyProtect	Reuse	Fresh

V3

25 decisions
25 correct
1 abstention

Intraprocedural baseline

6 decisions
5 correct
20 abstentions

Why the gap?

V3 follows helpers and scheme contracts. The baseline sees one function only and misclassifies record_id // 1 as reuse.

This is a transparent engineering baseline, not a state-of-the-art static-analysis comparison.

The remaining blocker is authentication utility

BIOMETRIC KEY-PROVENANCE ANALYSIS | 25 SEPTEMBER 2026

Frozen result

0 / 4 utility cells pass
All FMR bounds pass
TAR bounds fail

Decision for Sani

Review novelty
Approve utility margin
Choose next cohort

Do not claim lower risk without utility cost.
